**Revision of some type-specimens of European
Ichneumonidae (Hymenoptera)**

Abstract. The paper concerns 84 species of the *Ichneumonidae* (subfamilies: *Phygadeuontinae* and *Ichneumoninae*). Basing on several collections, the descriptive types of 107 species-group forms described by 10 authors have been investigated, 22 lectotypes selected, 44 new synonyms and 31 new combinations proposed, and 6 forms raised to the species status. Descriptions of unknown male, resp. female, of two species, as well as new distributional data for 6 species have been added.

A considerable number of the *Ichneumonidae* types is still unknown. All the information and notices about recovered types and their proper attachment to particular genera are very valuable, because they give facilities for future revisions of chosen genera. This paper contains a revision of some recovered types described by L. DUFOUR, E. PERRIS, J. L. C. GRAVENHORST, H. HABERMEHL, Z. v. KISS, K. PFANKUCH, A. ROMAN, G. STROBL, O. SCHMIEDEKNECHT and E. L. TASCHENBERG. Taxonomic remarks and faunistic data for some of the species are given, too.
